Road Improvement Committee Final Report

Background

The town of Raymond has over 70 miles of Town owned roads that it has the responsibility to service and maintain. The Current and projected conditions of those roads has been identified as an area of concern by Town populace and Town leadership. Responding to those concerns, the 2011 annual Town meeting approved a warrant article to establish a Road Improvement Study Committee (Committee). The purpose of the committee would be to evaluate the current condition of Raymond's public road system and to make recommendations for financial strategies to achieve necessary capital improvement work. The committee would investigate the use of long and short-term construction bonds, annual Capital Improvement funding, and any other funding mechanisms available.

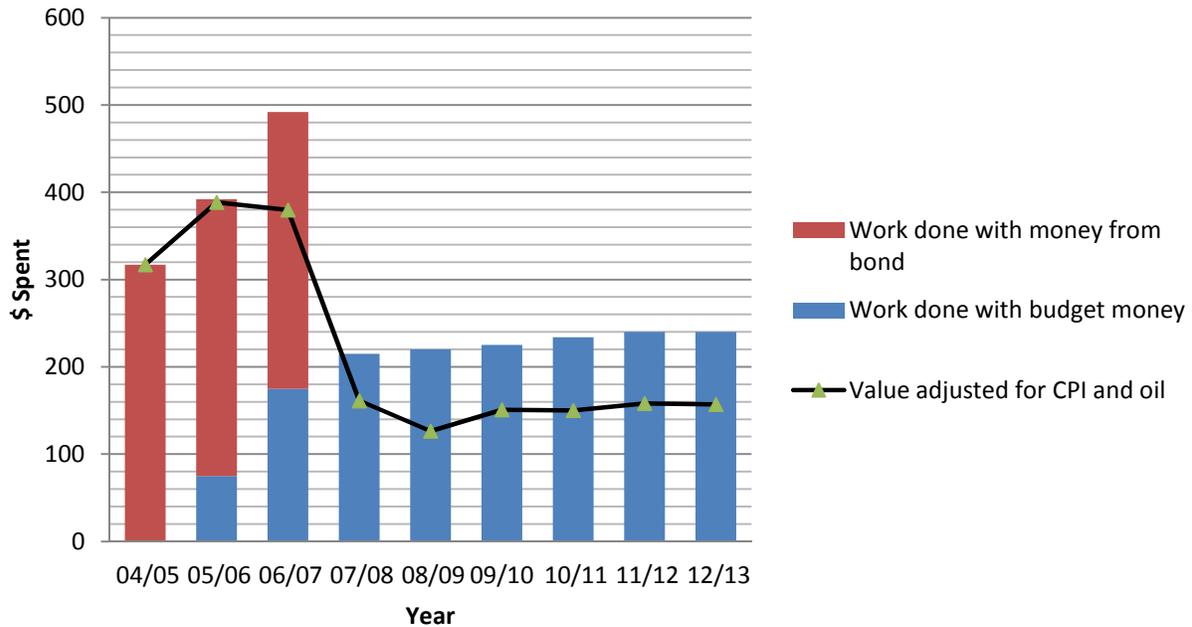

The Board of Selectmen (BOS) solicited interested individuals to serve on this committee, from those expressing interest appointed, commissioned a committee consisting of Rolf Olsen, Sam Gifford, Bob Harmon and Nathan White to perform the study, and reports its findings to the BOS for action by the BOS.

The following summarizes the research and give the committee's recommendations on work and financing.

History

Historically, the Town of Raymond has utilized a pay as you go financing model for road maintenance and construction. With the lone exceptions of a \$950,000 bond in 2004, the annual budgeted allotment for road construction and maintenance has been less than 240,000 per year. In several years, the amount allocated was reduced to less than \$100,000 in order to minimize total budget. The bond was issued to pay for work beyond maintenance and was initiated because the annual funding was both inadequate to fund major reconstruction and was continually subject to reduction. From 2008 to present the annual funding has increased year-to-year, but when the price of materials and inflation is factor in, the amount budgeted has remained relatively flat. This level of funding, while sufficient for maintenance, does not allow for reconstruction.

Road Improvement Committee Final Report

The chart above shows the annual expenditures from 2004 thru the currently proposed budget. Based on LD1 and the desire to keep the municipal budget within LD1 limits, bringing the roads in town back to reasonably expected standards cannot be accomplished at the current funding levels. As can be seen, even with increases in funding year to year, when compared to 2004 dollars, the effective road maintenance capabilities is less than that spent in 2007/2008. The committee was established to review current conditions and make recommendations on work to be done and ways to finance that and ongoing maintenance of the road network.

Process

The committee set three major tasks to be accomplished; a determination of current condition of the road inventory, a priority of roads to be worked on, and ways of funding the proposed work. In each of the tasks, the committee drew on expertise from both town employees and outside experts.

Road Improvement Committee Final Report

Current road conditions

The committee reviewed two reports generated under the pavement management program (attachments I and II). The first is a listing of all roads in the town identifying them as private, town or state. The second report lists the town roads, the type work required, the priority and the year reconstruction work was performed.

We reviewed a presentation from Nathan White highlighting current condition of town roads and needed maintenance. The highlights of the presentation are:

The town is responsible for only for the maintenance and reconstruction of the town accepted roads. The town is responsible for plowing the state routes [85, 121]. The state is responsible for maintenance for Route, 85, 121, & 302. Roads designated as commuter roads that the town maintains are Valley Rd., Plains Rd., and Main Street for a total of 4.440 miles. Priority roads in developments [subdivisions] are Panther Pond Pines, Patricia Ave., Canal Road & Salmon Run, Tarkiln Hill to the "t", and Tenney Hill Road for a total of 2.975 miles. Tenney Hill and Tarkiln are presently in the worst shape. Major problems come from alligator edging on the road edges which makes the roads difficult to maintain. The cost is \$160,000 per mile for reclaiming and \$2.50/ft for ditching. Culverts purchase and installation are \$74/ft. One mile of overlay at 1.5 inches depth is \$65,000. He felt Raymond should be completing 4 miles per year in order to have a 10 year turn around schedule. Asphalt maintenance mulch of 1" depth will give about 10 years of service at \$30,000/mile. The plan is to do 1 mile of Valley Road this year and next year the second mile and then overlay it to keep it for a long time. He thought working this schedule should have by 2015 all roads to a point where they will need only overlay to keep them serviceable on a 4 to 5 year cycle. Mr. White added that beyond the cost of asphalt they should consider the additional cost of \$30,000 per year for construction costs i.e. ditching, surface preparation, patching, cracking sealing etc. He noted that they were going to use a computer Local Road Program developed by the state to track Raymond's road work.

While the state has the responsibility for repair and maintenance of Route 85 and 121 we have seen historically that they are unwilling to fully fund any major work on these roads. Currently the MDOT is scheduled to apply 5/8" maintenance mulch to the south end of Rte 85 and the Egypt road and to do pave with the 5/8" mix route 85 from Raymond Hill toad to Route 11 and on Route 121 from Tower Road to Route 11 without any co-funding from the Town, any major reconstruction on these roads would be done under a plan where the State pays 50% and the Town pays 50%, but the Town administers the project.

Road Improvement Committee Final Report

Financing

The committee reviewed four methods of financing the reconstruction work; pay as you go, bonding thru Maine Bond Bank, local bank loans, and the town issuing its own bond.

Pay as you go

The pay as you go approach would entail budgeting \$667,000 per year for 3 years to cover major reconstruction. To ease the full impact this could be extended to four years so the annual amount would be 500,000. This amount is in addition to the maintenance funding of \$275,000 per year.

The drawback to this approach is there is not a mechanism for committing this annual expenditure and the annual amount is subject to modification during the budgeting and town meeting process. Modification of the amount affects what work can be done and is less efficient from a scheduling standpoint. In all likelihood this approach would lead to less work being done as the probability is high (as demonstrated historically) that downward adjustment would be made in the funding and simply moving the problem down the road and, due to material and labor increases, increase the total cost of reconstruction.

Local bank financing

Local banks currently are offering low and competitive rates and can be responsive to local needs and projects. The application process is straight forward and the application and approval time are short. For loans under \$500,000 and a payment term of 5 years or less the current rates are in the 3% range. However, for loans larger than \$500,000 and payment terms greater than 5 years, the rates will vary with only the first 5 years guaranteed and the subsequent year rates tied to a variable index.

Maine Municipal Bond Bank

The MMBB issues bonds in May and October and applications are due 4 months prior to the sale of the bonds. The only cost associated with the bond is for bond counsel in the amount of \$2,500. This cost is rolled into the bond. Current rates for a 10 year bond are 3% which increase year to year and ends at 4% in year 10. There is no flexibility in tailoring payments over the life of the bond. Funds received must be spent within 3 years of receipt of the funds

Town issue Bond

Accessing the bond market as an individual town takes approximately 8-12 weeks. Issuance costs are a function of the size of the issue, and typically will be in the range of \$40,000. Typically the issuance cost is "built into" the financing. The issuance cost includes costs for a bond rating from Moody's and/or S&P, the preparation of the bond tender documents and the sale of the bonds. Part of the evaluation

Road Improvement Committee Final Report

criterion for the bond rating is a review of current town assets including capital items to determine potential unanticipated or unplanned capital expenditures that could impact repayment capabilities.

The issue can take place at any time and there is some flexibility in structuring the payment terms. Based on the current market and a reasonable rating, interest rates on a 10 year bond are about 2%

Committee Recommendations

It is recommended that maintenance and rebuilding be handled separately. The maintenance should be handled under the annual budgeting at a rate of \$275,000 indexed to COLA. The rebuilding should be financed by a 10 year town issued bond. The priority on rebuilding should be driven by the paving management program as the primary prioritizing document but approved by the Select Board. Work on Routs 85 and 302 should be included in the management program from a timing standpoint, but work not undertaken unless the State pays a minimum of 50% Maintenance similarly should be prioritized through the paving management program. The paving management program should be a guiding document (program) and not an absolute as deviations will naturally occur due to accelerated wear, environmental and other factors. However deviations from the prioritized list once approved by the Select Board should be minimized and done with the minimum compromise to the plan.

The rebuilding of the roads will be initially funded thru the \$2 million bond with the anticipation of rebuilding of 13.9 miles of road in the 3 years of spending on the bond. With the rebuilding of roads and continuing ongoing maintenance, it is anticipated that a similar amount (indexed) will be required when the bond expires. Funding for the new expenditure will need to be evaluated near that time to determine the optimal funding mix.

Summary

The current conditions of the town owned roads in Raymond are currently in fair to poor condition, the amount appropriated in the past and current budgets allow for some maintenance and very limited amounts of reconstruction. If this trend continues, we will experience high rates of road failure and emergency funding will be required to bring them back to good condition. By maintaining our maintenance budget while bonding \$2 million for reconstruction and properly planning the timing of reconstruction and maintenance, we will prevent the situation from getting ahead of us and costing us more due higher levels of reconstruction that would be required. Town bonding has been recommended for the rebuilding work because of the historically low rates on bonding currently available and the flexibility offered us when compared to using the Maine Bond Bank. Bonding allows us to spread the cost of the work over the 10 year span and thus leveling year-to-year funding in the Town budget.
